Descriptive Statistics Cheat Sheet

1 Classification & Tabulation of Univariate Data

- Univariate Data: Data with only one variable (e.g., height of students).
- Classification: Organizing data into groups/classes.
- Types:
 - Qualitative (categorical: color, gender)
 - Quantitative (numerical: height, weight)
- Frequency Distribution Table:
- Class Interval (CI): Range of values (e.g., 10-20, 21-30)
- Frequency (f): Number of occurrences in each CI

•

2 Graphical Representation

- Bar Chart: Used for categorical data.
- Histogram: Represents frequency distribution of continuous data.
- Pie Chart: Shows proportions as slices of a circle.
- Frequency Polygon: Line graph connecting midpoints of class intervals.
- Ogive (Cumulative Frequency Curve):
- Less than ogive: Plots cumulative frequency for "less than" class boundaries.
- More than ogive: Plots cumulative frequency for "more than" class boundaries.

•

3 Frequency Curves

- Bell-Shaped Curve (Normal Distribution)
- Positively Skewed (Right-Skewed)
- Negatively Skewed (Left-Skewed)
- J-Shaped Curve
- U-Shaped Curve

4 Descriptive Measures

A. Measures of Central Tendency

- Mean (or x):
- Formula: $x = \sum xin \cdot bar\{x\} = \frac{sum x}{n} \cdot x = n \sum xi$
- For grouped data: $x = \sum fx \sum f \cdot f(x) = \frac{s \cdot f(x)}{s \cdot f(x)} = \frac{f(x)}{s \cdot f(x)} =$
- Median (M):
- Middle value when arranged in order.
- Formula (for grouped data):
 - $M=L+(n2-CFf)\times hM=L+\left(\frac{n}{2}-CF\right)\times hM=L+(f2n-CF)\times hM=L+(f2n-CF)\times$
- LLL = Lower boundary of median class
- nnn = Total frequency
- CFCFCF = Cumulative frequency before median class
- fff = Frequency of median class

```
hhh = Class width
Mode (Z):
Most frequently occurring value.
Formula (for grouped data):
    Z=L+(f1-f02f1-f0-f2)×hZ = L + \left( \frac {f_1 - f_0} {2f_1 - f_0 - f_2} \right) \times hZ=L+(2f1-f0-f2f1-f0)×h
    f1f_1f1 = Modal class frequency
    f0f_0f0 = Previous class frequency
    f2f_2f2 = Next class frequency
```

B. Measures of Dispersion

```
• Range = Maximum - Minimum
```

- Variance (σ² or s²):
- Population: $\sigma 2 = \sum (xi \mu) 2N \cdot \frac{2}{\sum (xi \mu)^2} \{N \cdot \sigma^2 = \sum (xi \mu)^2 \} \{N \cdot \sigma^2 = N \cdot$
- Sample: $s2=\sum(xi-x^{-})2n-1s^{2} = \frac{(xi-x^{-})2n-1s^{2}}{(xi-x^{-})2}$
- Standard Deviation (σ or s):

```
\sigma=\sigma 2 \times = \sqrt{\frac{\sin a^2}{\sigma - \sigma^2}}

s=s2s = \sqrt{s^2}s=s2
```

• Coefficient of Variation (CV):

 $CV = \sigma \mu \times 100CV = \frac{\langle sigma \rangle \langle mu \rangle}{times 100CV} = \mu \sigma \times 100CV$

5 Bivariate Data

- **Definition**: Data with two variables (e.g., height & weight).
- Scatter Plot: Graphical representation of bivariate data.

Summarization of Bivariate Data

Mean of X (): x=∑xin\bar{x} = \frac{\sum x_i}{n}x=n∑xi
 Mean of Y (): y=∑yin\bar{y} = \frac{\sum y_i}{n}y=n∑yi

Marginal & Conditional Frequency Distributions

- Marginal Frequency Distribution: Row or column sums in a contingency table.
- Conditional Frequency Distribution: Probability of one variable given a specific value of another.

Key Formulas Summary

Measure	Formula
Mean	$x^{-} = \sum xin \cdot \{x\} = \frac{x_i}{n} \cdot x_i = n \cdot x_i$
Median (Grouped)	$ \begin{split} M = & L + (n2 - CFf) \times hM = L + \left(\frac{frac}{n} \{2\} - CF\} \{f\} \right) \times hM = L + (f2n - CF) \times h \end{split} $
Mode (Grouped)	$ \begin{split} Z &= L + (f1 - f02f1 - f0 - f2) \times hZ = L + \left(\frac{f_1 - f_2}{f_0} \right) \\ &= L + (2f1 - f0 - f2f1) \times hZ = L + (2f1 - f0 - f2f1) \\ &= L + (2f1 - f0 - f2f1) \\$

Measure Formula

$$\label{eq:continuity} \begin{split} \sigma2 = & \sum (xi - \mu)2N \cdot sigma^2 = \left\{ \cdot \left\{ \cdot \right\} (x_i - \mu)^2 \right\} \\ & \left\{ N \right\} \sigma2 = & N \sum (xi - \mu)^2 \end{split}$$
Variance

 $\sigma = \sigma 2 \simeq ma = \sqrt{\frac{\sin^2 2}{\sigma}}$ Standard Deviation

CV $\sigma\mu\times100\frac{\sigma\mu\times100}{\frac}$ \times $100\mu\sigma\times100$
